

WIRELESS

WAREHOUSING Intech's RF Warehousing System

Overview

The Intech **WIRELESS WAREHOUSING** system is an add-on module for the main Intech Inventory and Sales systems such as:

- **FABRICS** Textile system
- **MAGIC** Apparel System
- **STOCK** Inventory system

It is designed to create a fast and efficient real-time pick of orders using scanners instead of paper Packing Slips.

Picking jobs are sent to RF Picking Streams and can be prioritised for urgent/non-urgent, high, medium or low picks, by Packing Slip i.e. for one Customer Order at a time, or by Product Type.

All functionality is done on the scanners, and allows the users to do the following functions without having to access a warehouse/office PC to view the system:

- Choose and pick an order from one of the above Pick-streams
- Inquire on what goods are located within a Bin
- Put-away goods to a new Bin
- Re-allocate goods if an alternative pick is found
- Decline that item
- Inquire on a Product to see where it is located in the warehouse and how many are left
- Stocktaking goods

WIRELESS WAREHOUSING is designed to fast-track the warehousing processes without the need for paper picking, PC checking, and manual processes. When in a pick, it will send the user on a path around the warehouse that maximises their time by selecting the bin locations in a logical sequence for picking and packing.
